■ SUNO

v 2.0

SUNO BACKUP

Never lose a song again.

Your Suno library, downloaded locally. Every format. Every track. One click.

Why This Exists

You've spent hours — maybe *hundreds of hours* — creating music on Suno. Prompts perfected, styles refined, hidden gems buried three pages deep in your library. **Suno doesn't have a bulk export button.** You do now.

Suno Backup scans your entire library using Suno's own private API, extracts every song ID it can find, and downloads everything to your local machine — organized, labeled, and ready for any DAW, streaming service, or personal archive.

What Gets Downloaded

- ■ **MP3 Audio**
- ■ **WAV Lossless**
- ■ **WEBM Video**
- ■ **Cover Art**
- ■ **Metadata JSON** — Full API response — prompts, tags, model version, play stats
- ■ **CSV Index** — Your entire library in a spreadsheet, CDN URLs pre-computed

■ Quick Start

No terminal experience needed. Just double-click and log in.

Platform	Launch file	Mode
Windows	`START_WINDOWS.bat`	CLI
macOS / Linux	`START_MAC_LINUX.sh`	CLI
Windows	`START_GUI_WINDOWS.bat`	GUI
macOS / Linux	`START_GUI_MAC_LINUX.sh`	GUI

Any	`python setup_and_run.py`	CLI

On first run, the tool automatically: creates a venv, installs dependencies, installs Playwright Chromium, opens a browser for login, scans your full library, exports a CSV index, then downloads everything — skipping files already on disk.

How the Library Scanner Works

Phase	Method	What it finds
1	API feed pagination /api/feed/v2/?page=N	Everything Suno officially exposes through its paginated feed
2	DOM scraping (headless browser)	UUIDs in image_{id}.jpeg, {id}.webm, {id}.mp3, /song/{id} hrefs, JSON blobs
3	Batch enrichment /api/get_songs_by_ids?ids=...	Full metadata for IDs found in DOM but missing from the API feed

Security — Encrypted Token Vault

Your login tokens never leave your machine. Tokens are encrypted with **Fernet (AES-128-CBC + HMAC-SHA256)** and stored in a hidden `.suno_vault` file.

The encryption key is derived from your machine's unique hardware fingerprint — hostname, MAC address, machine GUID, and a locally-generated random salt. **The vault file is unreadable on any other machine.** Tokens auto-refresh before expiry so long backups don't fail mid-run.

Token Flow

```
your login  →  browser session  →  token captured  →  AES encrypted  →  .suno_vault
                                          ↑
                                machine fingerprint + random salt
```

Output Structure

```
suno_library/
■■■ suno_library.csv          your full library in a spreadsheet
■■■ song_ids.txt              plain list of every discovered ID
■
■■■ Midnight_Frequency__43b0804d/
■   ■■■ metadata.json         prompt, tags, model, play stats
■   ■■■ image_43b0804d.jpeg   cover art
■   ■■■ Midnight_Frequency.mp3
■   ■■■ Midnight_Frequency.wav
■   ■■■ Midnight_Frequency.webm
■
■■■ Desert_Radio__8f2a1c9e/
    ■■■ ...
```

■ CSV Index Columns

Column	Description
`id`	Song UUID
`title / display_name`	Song name
`audio_url`	MP3 stream URL
`wav_url`	WAV CDN URL (pre-computed)
`video_url`	WEBM video URL
`image_large_url`	High-res cover art URL
`model_name`	Suno model version used
`tags / prompt / style`	Generation metadata
`play_count / upvote_count`	Engagement statistics
`created_at`	Creation timestamp
`source`	Discovery method (api_feed / dom_scan)

■ Configuration

All settings live in `config.py` — the single source of truth. The GUI exposes the most common ones; power users can edit the file directly.

```
# config.py — toggle what gets downloaded
DOWNLOAD_MP3   = True
DOWNLOAD_WAV   = True     # Pro subscribers
DOWNLOAD_VIDEO = True     # Pro subscribers
DOWNLOAD_ART   = True
DOWNLOAD_JSON  = True

# Human-like jitter to avoid bot detection
RATE_LIMIT_WAV_MIN  = 4.0   # seconds between WAV conversions
RATE_LIMIT_WAV_MAX  = 8.0
RATE_LIMIT_PAGE_MIN = 1.5   # seconds between feed pages
RATE_LIMIT_PAGE_MAX = 3.5
```

Troubleshooting

Problem	Fix
Python not found	Install Python 3.9+ from python.org Check 'Add to PATH' on Windows
Login window doesn't appear	Run python setup_and_run.py from terminal directly
WAV fails for some songs	Song may not be WAV-eligible; tool logs it and continues
Auth error mid-backup	Re-run — already-downloaded files are automatically skipped
Vault decryption error	Delete .suno_vault and .vault_salt, then re-run
CSV is empty	Confirm you're logged into the correct Suno account
Rate limited	Increase RATE_LIMIT_*_MIN/MAX values in config.py

■ Requirements

Package	Version	Purpose
`playwright`	>= 1.40	Browser automation & token capture
`requests`	>= 2.31	HTTP downloads
`tqdm`	>= 4.66	Progress bars
`cryptography`	>= 41.0	Vault encryption (AES Fernet)

All packages are auto-installed on first run. Nothing to do manually.
